

♥ KawaiiCompanion

An AI friend that actually lives inside your Minecraft world — she walks beside you, talks back, and remembers you.

TL;DR — in one breath

A custom Minecraft server plugin that gives every player their own little anime-style companion. She follows you around the world, you chat with her in real conversation, she remembers past talks, levels up, fights monsters for you, and can even turn into any creature in the game. Think “a Tamagotchi with a real brain, living in Minecraft.”

Wait... how can she even exist?

If you've never seen this before, here's the magic, explained simply — no tech degree needed:

1. Her body

She's built from a real in-game player character — the same kind the game uses for you. So she has a face, a skin, pink armor, and a name floating above her head.

2. Her brain

When you talk to her, your words go to a real AI language model. It writes a reply in her cute personality and sends it back — a live conversation, not pre-written lines.

3. Her memory

Every chat is saved to her own little diary file. Next time you log in she remembers what you said before, so she feels like a friend, not a chatbot reset every time.

What makes her feel alive

- ♥ **She watches you** turns her head to look at you and at nearby animals.
- ♥ **She reacts** waves when you return, yawns & stretches before resting.
- ♥ **She heals you** tops up your health when you're low and nearby.
- ♥ **She keeps up** sprints, climbs ladders, and hops up stairs to follow you.
- ♥ **She spots danger** warns you when you're hurt, drowning, or on fire.
- ♥ **She knows the scene** talks about the real cow next to you, the weather, the time.

She grows with you ★

Levels & powers

She earns XP, levels up, and unlocks abilities: faster movement, healing, and fighting right alongside you.

Shape-shifting

She can transform into any creature in the game, each with its own fighting style — but she only ever attacks monsters, never your friends or pets.

Why this is hard to build (and why it's good work)

Minecraft was never designed to have a character like this. Making a believable, “living” companion meant hand-building her movement, animations, and reactions deep inside the game's engine, then wiring her up to a live AI brain and a memory system — all running smoothly on a real multiplayer server, for every player at once, without lag or breaking the game's rules. It's part game development, part AI integration, part character design.
